/note="Vector: Lambda Uni-ZaP XR, excised phagemid;
Site_l: EcoRI; Site_2: xhoi; Plants were grown in the greenhouse. Whole spike with awns trimmed, white, green and yellow anther were collected and total RNA, and poly(A) RNA were prepared, a cDNA library was made, and the CDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

XhOI; This CDNA library was constructed from mRNA isolated
from cotyledons of 3- and 7-day-old Williams seedlings
which were propagated on paper towels with distilled
water. The cotyledons were flash-frozen in liquid
nitrogen, then lyophilized for 72 hours. Unequal amounts
of mRNA was used for CDNA synthesis. Stratagene's CDNA
Synthesize the CDNA. First- stranded synthesis was
performed with 5-methyl dCTP, hence the ligated CDNA was
hemimethylated. A modification of Stratagene's
first-strand synthesis primer was used. An anchor
nucleotide (V-A, C, or G) was added to the 3' end of the
primer [GACAGAGAGAGAGAGAACTAGTCTCGAG(T)18] to anchor
the primer at the 5' end of the poly(A) tract
second- strand synthesis, the CDNA ends were filled in
with cloned Pfu DNA, ligated to ECORI adapters and
subsequently phosphorylated. The XhOI site within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Washington University School of Medicine

first-strand synthesis primer was then restricted by digestion with XhoI; all XhoI sites in the CDNA would be protected by their hemimethylated status. The CDNA constructs were size-fractionated with a 500 bp cutoff, using GibcoBRL Life Technologies' CDNA Size Fractionation column. The column eluent was then ligated into Stratagene's pluescript(Lm) II XR Predigested vector (pBluescript II SK(+) that has been digested with EcoRI and XhoI, and phosphorylated by Stratagene). 97% of the white and blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n=30). This library was constructed by Dr. Paul Keim and Dr. Virginia Corpeil.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       yrAlaMetGlnTyrGlyThrValProvalValHisGlyThrGlyGlyLeu 563

XhoI: This cDNA library was constructed from mRNA isolated
from cotyledons of 3- and 7-day-old Williams seedlings
which were propagated on paper towels with distilled
water. The cotyledons were flash-frozen in liquid
nitrogen, then lyophilized for 72 hours. Unequal amounts
of mRNA was used for CDNA synthesis. Stratagene's CDNA
Synthexix Kit (catalog number 200401) was used to
synthesize the CDNA. First- stranded synthesis was
performed with 5-methyl dCTP, hence the ligated CDNA was
hemimethylated. A modification of Stratagene's Shoemaker, R., Kelm, P., Vodkin, L., Erpelding, J., Coryell, V., Khanna, A., Bolla, B., Marra, M., Hillier, L., Kucaba, T., Martin, J., Beck, C., Wylie, T., Underwood, K., Steptce, M., Theising, B., Martin, Bowers, Y., Person, B., Swaller, T., Gibbons, M., Pape, D., Harvey, N., Schurk, R., Ritter, E., Kohn, S., Shin, T., Jackson, Y., Cardenas, M., McCann, Public Soybean EST Project

High quality sequence stop: 396. first-strand synthesis primer was used. An anchor nucleotide (V-A, C, or G) was added to the 3' end of the primer [GAGAGAGAGAGAGAGAAACTAGTCTCGAG(T)18] to anchor the primer at the 5' end of the poly(A) tract. After second strand synthesis, the cDNA ends were filled in with cloned Pfu DNA, ligated to Ecorl adapters and subsequently phosphorylated. The XhoI site within the first-strand synthesis primer was then restricted by /tissue_type="cotyledons of 3- and 7-day-old Williams Washington University School of Medicine 4444 Forest Park Parkway, Box 8501, St. Louis, MO 63108, USA Tel: 314 286 1810 Fax: 314 286 1810 /organism="Glycine max"

digestion with XhoI; all XhoI sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with a 500 bp cutoff, using GlbcoBRL Life Technologies' cDNA Size Fractionation column. The column eluent was then ligated into Stratagene's pBluescript(tm) II XR Predigested vector (PBluescript II SK(+) that has been digested with EcoRI and XhoI, and phosphorylated by Stratagene). 97% of the white and blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n=30). This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell."

//note="Vector: pBluescript SK-: Site_1: ECORI; Site_2:
XhoI: Construction of the cDNA library was carried out
using Stratagenes 'UnizaP - cDNA synthesis kit'. cDNA was
constructed using an oligo dT primer/linker that contains
a XhoI site within it. Pollowing ds cDNA synthesis,
EcoRI adapters were ligated to the blunt ends and sample
was digested with XhoI. The result is CDNA with an ECORI
sticky end on one side and a XhoI sticky end on the other.
This cDNA was ligated directionally in OnizAP arms. The
vector is designed containing the pBluescript sequence as
well as lambda DNA and cDNA is cloned within this
pBluescript sequence. The vector was then packaged using
Gold gigapackaging extracts. Library was grown in XIIBlue
MRF' cells and amplified. The library was excised by mass
excision using Stratagens 'Mass excision kit' that uses
excision using Stratagens 'Mass excision kit' that uses
excision using Stratages (by helper phage) and secreted out
of the host cell as phagemids. SOLR cells were transformed
with phagemids and the library was plated out on LB-amp
plates to select for transformants. Approximately 1,000
'000 colonies were grown and recovered. The double
stranded plasmid library was recovered by using Qulagen
Midi prep kit. 2 micro grams of each library were used to

/lab_host="E. coli BM25.8"
/note="Organ: shoot tips; Vector: Lambda TriplEx; Site_1:
Sfil (A); Site_2: Sfil (B); Shoot tips (approx. 2 cm from apex) were collected during the spring, frozen and used for mRNA isolation. The SMART-PCR method (Clontech) was used to prepare a library from 1 ug total RNA, using the Lambda TriplEx vector. Plasmid subclones in pTriplEx were recovered by cre-lox excision in E. coli strain BM25.8 and sequenced from the 5' end."
